

# CAT4139

## White LED Driver, 22 V, High Current Boost

### Description

The CAT4139 is a DC/DC step-up converter that delivers an accurate constant current ideal for driving LEDs. Operation at a fixed switching frequency of 1 MHz allows the device to be used with small value external ceramic capacitors and inductor. LEDs connected in series are driven with a regulated current set by the external resistor R1. The CAT4139 is ideal for driving parallel strings of up to five white LEDs in series or up to 22 V.

LED dimming can be done by using a DC voltage, a logic signal, or a pulse width modulation (PWM) signal. The shutdown input pin allows the device to be placed in power-down mode with “zero” quiescent current.

In addition to thermal protection and overload current limiting, the device also enters a very low power operating mode during “Open LED” fault conditions. The device is housed in a low profile (1 mm max height) 5-lead TSOT-23 package for space critical applications.

### Features

- Switch Current Limit 750 mA
- Drives LED Strings up to 22 V
- Up to 87% Efficiency
- Low Quiescent Ground Current 0.6 mA
- 1 MHz Fixed Frequency Low Noise Operation
- Soft Start “In-rush” Current Limiting
- Shutdown Current Less than 1  $\mu$ A
- Open LED Overvoltage Protection
- Automatic Shutdown at 1.9 V (UVLO)
- Thermal Overload Protection
- TSOT-23 5-Lead (1 mm Max Height)
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

### Applications

- GPS Navigation Systems
- Portable Media Players
- Handheld Devices

# CAT4139

L: Sumida CDRH6D28–220  
D: Central CMSH1–40 (rated 40 V)

Figure 1. Typical Application Circuit

Table 1. ABSOLUTE MAXIMUM RATINGS

Parameters	Ratings	Units
VIN, FB Voltage	-0.3 to +7	V
SHDN Voltage	-0.3 to +7	V
SW Voltage	-0.3 to +40	V
Storage Temperature Range	-65 to +160	°C
Junction Temperature Range	-40 to +150	°C
Lead Temperature	300	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Table 2. RECOMMENDED OPERATING CONDITIONS (Typical application circuit with external components is shown above.)

Parameters	Range	Units
VIN	up to 5.5	V
SW pin voltage	0 to 22	V
Ambient Temperature Range (Note 2)	-40 to +85	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

2. TSOT23–5 package thermal resistance  $\theta_{JA} = 135^{\circ}\text{C}/\text{W}$  when mounted on board over a ground plane.

**Pin Description**

**V<sub>IN</sub>** is the supply input for the internal logic. The device is compatible with supply voltages down to 2.8 V and up to 5.5 V. It is recommended that a small bypass ceramic capacitor (4.7 μF) be placed between the V<sub>IN</sub> and GND pins near the device. If the supply voltage drops below 1.9 V, the device stops switching.

**SHDN** is the shutdown logic input. When the pin is tied to a voltage lower than 0.4 V, the device is in shutdown mode, drawing nearly zero current. When the pin is connected to a voltage higher than 1.5 V, the device is enabled.

**GND** is the ground reference pin. This pin should be connected directly to the ground plane on the PCB.

**SW** pin is connected to the drain of the internal CMOS power switch of the boost converter. The inductor and the Schottky diode anode should be connected to the SW pin. Traces going to the SW pin should be as short as possible with minimum loop area. An over-voltage detection circuit is connected to the SW pin. When the voltage reaches 24 V, the device enters a low power operating mode preventing the SW voltage from exceeding the maximum rating.

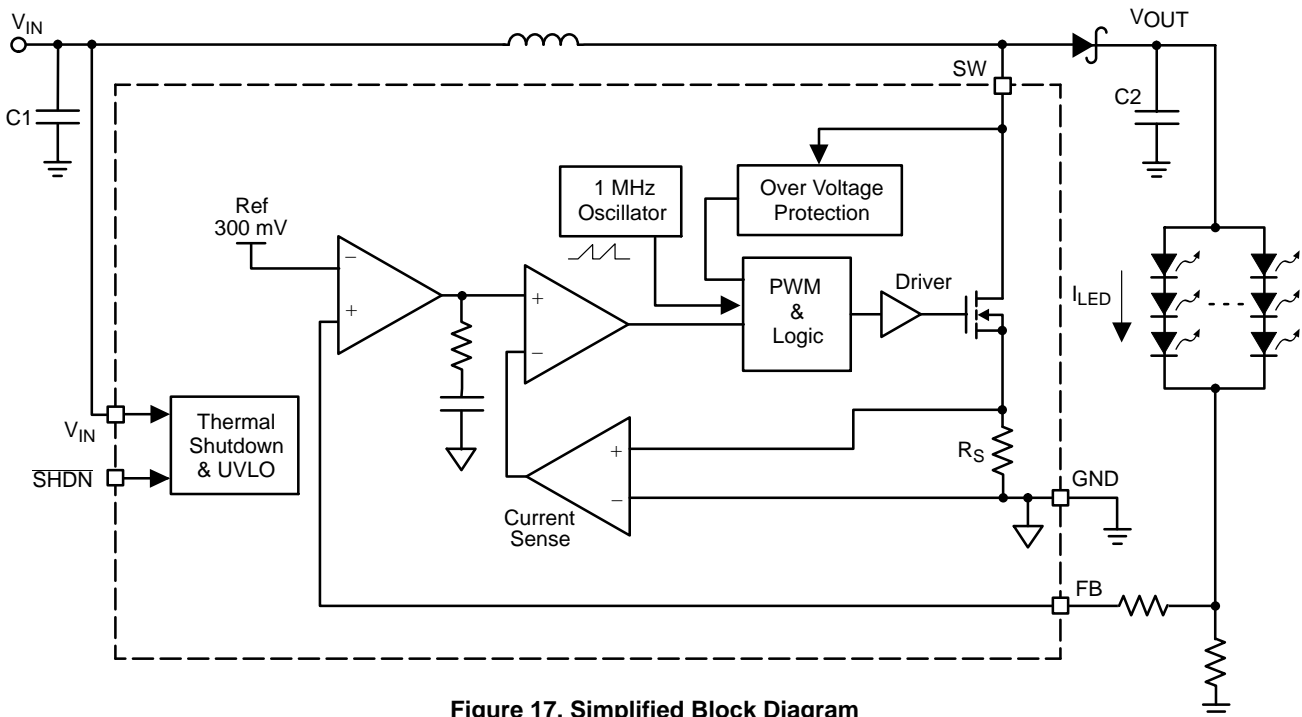

**FB** feedback pin is regulated at 0.3 V. A resistor connected between the FB pin and ground sets the LED current according to the formula:

$$I_{LED} = \frac{0.3 V}{R1}$$

The lower LED cathode is connected to the FB pin.

**Table 4. PIN DESCRIPTIONS**

Pin #	Name	Function
1	SW	Switch pin. This is the drain of the internal power switch.
2	GND	Ground pin. Connect the pin to the ground plane.
3	FB	Feedback pin. Connect to the last LED cathode.
4	SHDN	Shutdown pin (Logic Low). Set high to enable the driver.
5	VIN	Power Supply input.

**Figure 17. Simplified Block Diagram**

**Device Operation**

The CAT4139 is a fixed frequency (1 MHz), low noise, inductive boost converter that provides a constant current with excellent line and load regulation. The device uses a high-voltage CMOS power switch between the SW pin and ground to energize the inductor. When the switch is turned off, the stored energy in the inductor is released into the load via the Schottky diode.

The on/off duty cycle of the power switch is internally adjusted and controlled to maintain a constant regulated voltage of 0.3 V across the feedback resistor connected to the feedback pin (FB). The value of the resistor sets the LED current accordingly (0.3 V/R1).

During the initial power-up stage, the duty cycle of the internal power switch is limited to prevent excessive in-rush

currents and thereby provide a “soft-start” mode of operation.

In the event of an “Open LED” fault condition, where the feedback control loop becomes open, the output voltage will continue to increase. Once this voltage exceeds 24 V, an internal protection circuit will become active and place the device into a very low power safe operating mode.

Thermal overload protection circuitry has been included to prevent the device from operating at unsafe junction temperatures above 150°C. In the event of a thermal overload condition the device will automatically shutdown and wait till the junction temperatures cools to 130°C before normal operation is resumed.

**Application Information**

**External Component Selection**

**Capacitors**

The CAT4139 only requires small ceramic capacitors of 4.7 µF on the input and 1 µF on the output. Under normal condition, a 4.7 µF input capacitor is sufficient. For applications with higher output power, a larger input capacitor of 10 µF may be appropriate. X5R and X7R capacitor types are ideal due to their stability across temperature range.

**Inductor**

A 22 µH inductor is recommended for most of the CAT4139 applications. In cases where the efficiency is critical, inductances with lower series resistance are preferred. Inductors with current rating of 800 mA or higher are recommended for most applications. Sumida CDRH6D28-220 22 µH inductor has a rated current of 1.2 A and a series resistance (D.C.R.) of 128 mΩ typical.

**Schottky Diode**

The current rating of the Schottky diode must exceed the peak current flowing through it. The Schottky diode performance is rated in terms of its forward voltage at a given current. In order to achieve the best efficiency, this

forward voltage should be as low as possible. The response time is also critical since the driver is operating at 1 MHz. Central Semiconductor Schottky rectifier CMSH1-40 (1 A rated) is recommended for most applications.

**LED Current Setting**

The LED current is set by the external resistor R1 connected between the feedback pin (FB) and ground. The formula below gives the relationship between the resistor and the current:

$$R1 = \frac{0.3 \text{ V}}{\text{LED current}}$$

**Table 5. RESISTOR R1 AND LED CURRENT**

LED Current (mA)	R1 (Ω)
20	15
25	12
30	10
100	3
300	1

**Open LED Protection**

In the event of an “Open LED” fault condition, the CAT4139 will continue to boost the output voltage with maximum power until the output voltage reaches approximately 24 V. Once the output exceeds this level, the internal circuitry immediately places the device into a very low power mode where the total input power is limited to about 6 mW (about 1.6 mA input current with a 3.6 V supply). The SW pin clamps at a voltage below its maximum rating of 40 V. There is no need to use an external zener diode between VOUT and the FB pin. A 35 V rated C2 capacitor is required to prevent any overvoltage damage in the open LED condition.

**Figure 18. Open LED Protection Circuit**

**Figure 19. Open LED Disconnect and Reconnect**

**Figure 20. Open LED Disconnect**

**Figure 21. Open LED Supply Current**

**Figure 22. Open LED Output Voltage**

**Dimming Control**

There are several methods available to control the LED brightness.

**PWM Signal on the  $\overline{\text{SHDN}}$  Pin**

LED brightness dimming can be done by applying a PWM signal to the  $\overline{\text{SHDN}}$  input. The LED current is repetitively turned on and off, so that the average current is proportional to the duty cycle. A 100% duty cycle, with  $\overline{\text{SHDN}}$  always high, corresponds to the LEDs at nominal current. Figure 23 shows a 1 kHz signal with a 50% duty cycle applied to the  $\overline{\text{SHDN}}$  pin. The recommended PWM frequency range is from 100 Hz to 2 kHz.

**Figure 23. Switching Waveform with 1 kHz PWM on SHDN**

**Filtered PWM Signal**

A filtered PWM signal used as a variable DC voltage can control the LED current. Figure 24 shows the PWM control circuitry connected to the CAT4139 FB pin. The PWM signal has a voltage swing of 0 V to 2.5 V. The LED current can be dimmed within a range from 0 mA to 20 mA. The PWM signal frequency can vary from very low frequency and up to 100 kHz.

**Figure 24. Circuit for Filtered PWM Signal**

A PWM signal at 0 V DC, or a 0% duty cycle, results in a max LED current of about 22 mA. A PWM signal with a 93% duty cycle or more, results in an LED current of 0 mA.

**Figure 25. Filtered PWM Dimming (0 V to 2.5 V)**

# CAT4139

## Board Layout

The CAT4139 is a high-frequency switching regulator. The traces that carry the high-frequency switching current have to be carefully laid out on the board in order to minimize EMI, ripple and noise in general. The thicker lines on Figure 26 show the switching current path. All these traces have to be short and wide enough to minimize the parasitic inductance and resistance. The loop shown on Figure 26 corresponds to the current path when the CAT4139 internal switch is closed. On Figure 27 is shown

the current loop, when the CAT4139 switch is open. Both loop areas should be as small as possible.

Capacitor C1 has to be placed as close as possible to the VIN pin and GND. The capacitor C2 has to be connected separately to the top LED anode. A ground plane under the CAT4139 allows for direct connection of the capacitors to ground. The resistor R1 must be connected directly to the GND pin of the CAT4139 and not shared with the switching current loops and any other components.
